PREFACE

Traffic volume information is used by many people to assist them in assessing the viability of business proposals, land use options, marketing, advertising, and a host of other activities. This publication, **Provincial Highways Traffic Volumes 1989**, provides traffic volumes on an annual and seasonal average basis for selected links in the provincial highway network. The type of travel and accident rates on the selected links are also indicated.

The Provincial Highways Overall System Summaries, in Part I of this report, indicate that the growth in travel demand from 1988 to 1989 was 4.8%. The majority of this growth was on the freeway system in Southern Ontario.

Travel shown for the Provincial Total and 'Other Roads' was calculated from the data obtained from the 'Ontario Road Safety Annual Report'.

Some highway routes which have not yet been assigned an official highway number, such as the E.C. Rowe Expressway or the Sudbury Southwest Bypass, are included in Part V under the title Selected 7000 Series Highways.

The **Highway Planning Office** also issues the Historical and Permanent Counting Station Annual report. Site or time specific information can be obtained from the **Regional Traffic Sections** who conduct the data collection.

INTRODUCTION

This publication contains information pertaining to traffic volumes and accident rates on roads under Provincial jurisdiction as of December 31, 1989. The book is divided into two parts.

PART I

The information in this part is included for policy analysis and program planning purposes. It includes summaries about the overall Provincial Highways system and not specifics related to individual volume sections. The system indicators are developed from travel experience, accident data and highway geometrics.

PART II-V

A detailed listing of traffic volumes on Provincial Highways, (King's, Secondary, Tertiary Roads and the 7000 series highways) are provided.

The highway network is divided into 2,846 sections for reporting purposes. Seasonal traffic volume variations are estimated for each section reported. Although local conditions cause variations in the volume within the sections, the volumes shown are considered to adequately represent the section.

On highways with more than one route number,such as Highways 35 and Highway 115, the volume information is referenced to the lower number highway. When an overlap occurs between a freeway and non-freeway, reference is made to the freeway route number. The freeways are Highways 400 to Highway 427 and the Q. E. W.

The following is a KEY to reading the listings:

LOCATION DESCRIPTION

A statement identifying the start or ending of a section. Frequently used abbreviations (over the commonly known) include:

AV	:	avenue
BDY/BDRY	:	boundary
BR	:	bridge
C	:	concesssion
CORS	:	corners
CTY	:	county
IC	:	interchange
JCT	:	junction
L	:	lot
LTS	:	limits
R	:	river
REG	:	regional
TWP	:	township

DISTANCE (KM)

The length of the section in kilometres reported to one decimal place.

PATTERN TYPE

One of 14 pattern types that represent the seasonal variability of the traffic flow on the section indicated.

The 14 pattern types represent the traffic flow variation on the whole network. They include:

VARIATION TYPES

LOW	1. UC	:	urban commuter
	2. SC	:	suburban commuter
	3. C	:	commuter
INTER.	4. IC	:	intermediate commuter
	5. CR	:	commuter recreation
	6. IR	:	intermediate recreation
	7. CTR	:	commuter - tourist - recreation
	8. IT	:	intermediate tourist
HIGH	9. LT	:	low tourist
	10. T	:	tourist
	11. HT	:	high tourist
	12. LR	:	low recreation
	13. R	:	recreation
	14. HR	:	high recreation

The first three are generally referred to as Low Variation Curves (or Commuter Travel); the next five as Intermediate Variation Curves (a blend of all types of traffic); and the last six as High Variation Curves. For this last group, the first three represent tourist travel and the second three, recreational travel; this sub-grouping is distinguished by the relationship of weekend to weekday traffic.

There is one additional code "UNC" in the pattern type column. This means that the AADT was calculated using adjustment factors from an unclassified (i.e. new) permanent counting station.

A graphical presentation of these pattern types has been included on the following page.

AADT

Annual Average Daily Traffic; defined as the average twenty-four hour, two-way traffic for the period January 1st to December 31st.

SADT

Summer Average Daily Traffic; defined as the average twenty-four hour, two-way traffic for the period July 1st to August 31st. including weekends.

SAWDT

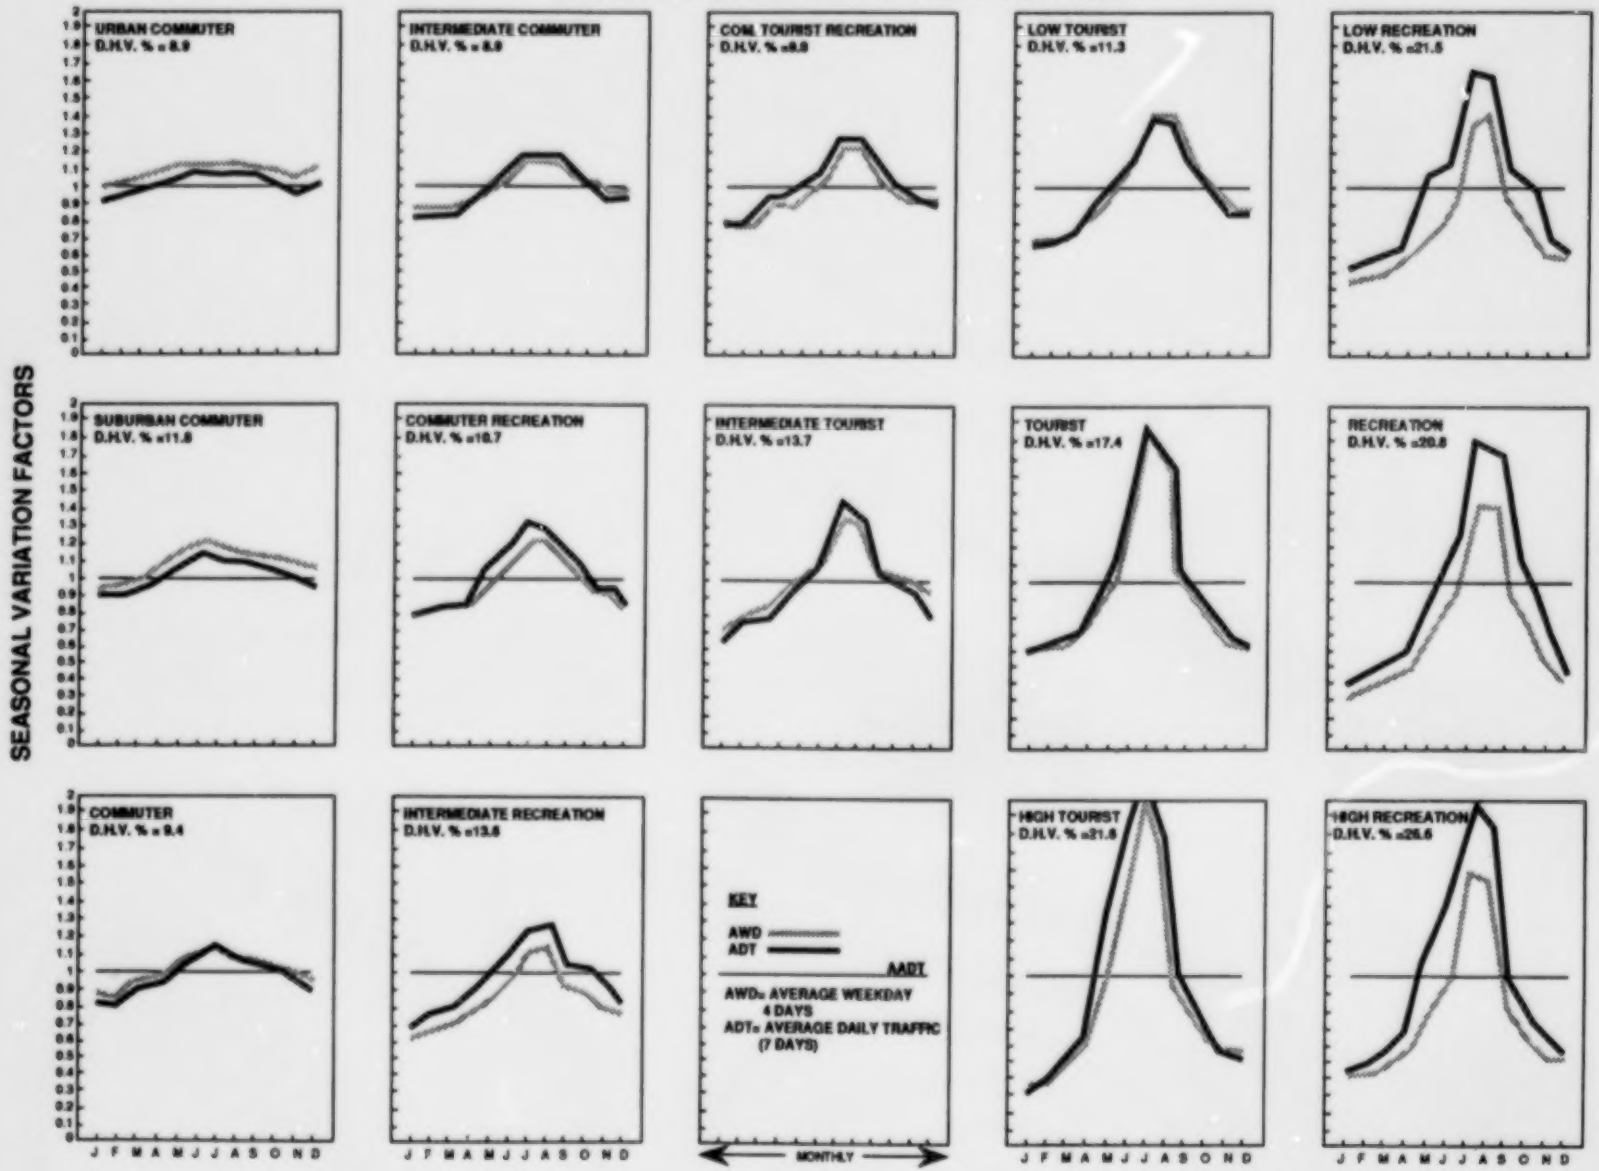
Summer Average Weekday Daily Traffic; defined as the average twenty-four hour, two-way, weekday traffic for the period July1st to Aug 31st, excluding weekends. Weekend traffic is defined to start at noon on Friday and end at noon on Monday for a normal short weekend.

A long holiday weekend would have an additional day either commencing at noon on the Thursday or ending at noon on the Tuesday, depending on whether the holiday falls on the Friday or the Monday.

WADT

Winter Average Daily Traffic; defined as the average twenty-four hour, two-way traffic for the period December 1st to March 31st including weekends.

1989 SEASONAL VARIATION CURVES



AR

Accident Rate; which is defined as the number of reportable accidents occurring annually on a particular highway section for every million vehicle kilometres (Mv - km) travelled on that section during the same period. "Reportable Accidents" are those causing any death, injury or damage exceeding a certain established amount. In 1978, the damage amount was increased from $200 to $400, and in 1985 from $400 to $700.

The accident rate is calculated as follows:

AR = the number of accidents for a given year divided by the Mv - km, noting the following:

The Mv - km is calculated as follows:

$$= \frac{\text{AADT} \times 365 \text{ days} \times \text{DIST (km)}}{1{,}000{,}000}$$

Notes

a. Multiple vehicle collisions (i.e., chain reactions are generally considered as one accident unless the reporting police officer decides otherwise).

b. Accidents on freeway ramps are totally excluded from sectional and total system accident rate calculations.

c. If no accidents have occured on a given section, the accident rate is shown as blank, not zero.

NOTE

The user of this publication should realize that the reported data are 'estimated values'. Since traffic volumes are not static, direct field measurements are accurate only for the time of the count. Also, the size of the Provincial Highway network makes it impractical to measure each section annually. Thus, approximately one third of the reported sections are counted each year. The following three methods of measuring traffic volumes are employed:

1. Permanent Counting Stations: At designated locations across the Province counts are taken for each hour of the year.

2. Inventory Counting Stations: Each unique volume section has a set location where traffic volumes are sampled on a cyclical basis by season and year.

3. Request Counting Stations: Traffic volumes are measured at random locations as needed to address operational or planning concerns.

Using the available traffic volume information and historical trends, estimates are made for each volume section.

PART I

Overall System Summaries

TRAFFIC VOLUME AND SAFETY HIGHLIGHTS

- Travel experience on Provincial highways (i.e. excluding "Other Roads") shows an increase of 4.8% or 2.08 billion kilometres of travel.
- Growth in travel on the Freeway system was highest of all and accounted for 61% of the total increase on Provincial highways.
- Growth in travel on the other King's highways amount to 49% of the total increase on Provincial highways.
- Secondary highways are also contributing to the overall travel growth with an increase of 2.7%.
